Lab 4: Prototyping a Network

Nikita Ajit Chitre

TE Comps

UID: 2018130006

Date: 6-09-20

Objective:

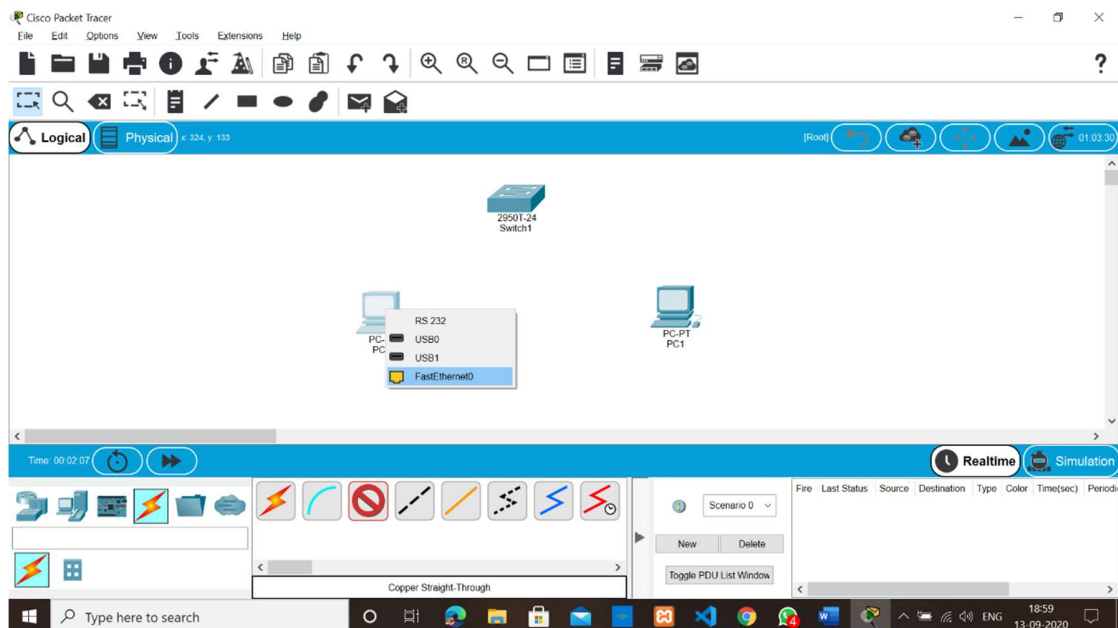

Prototype a network using Packet Tracer

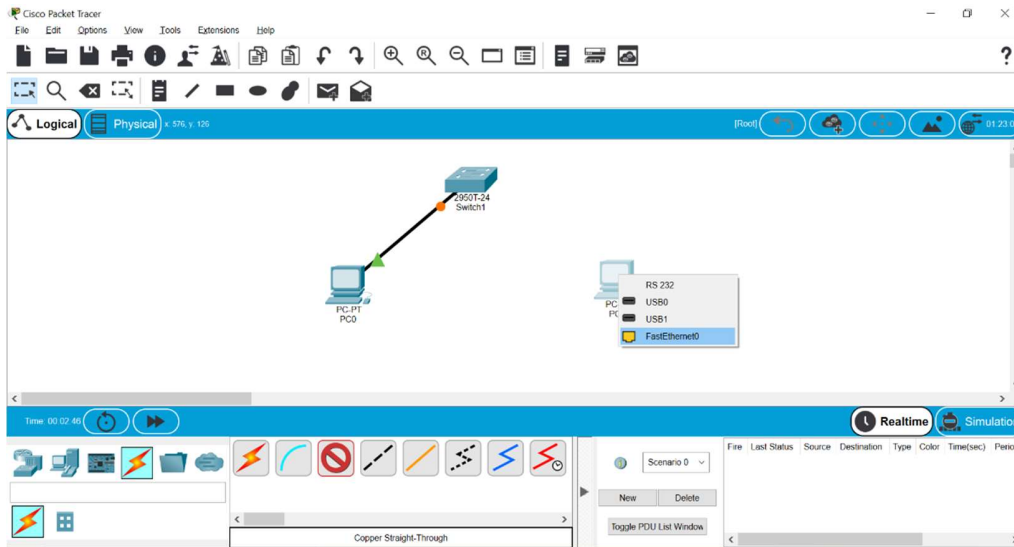

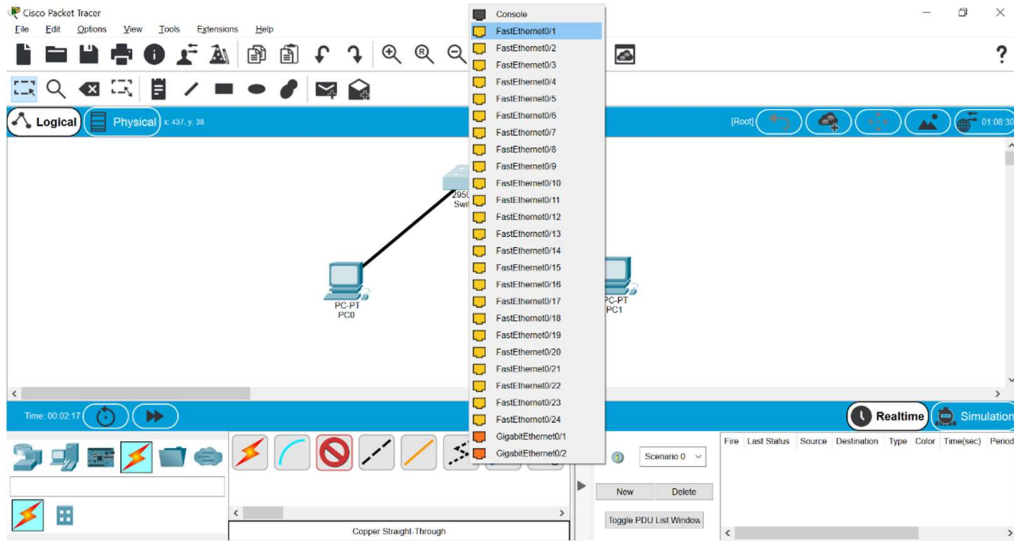

Background

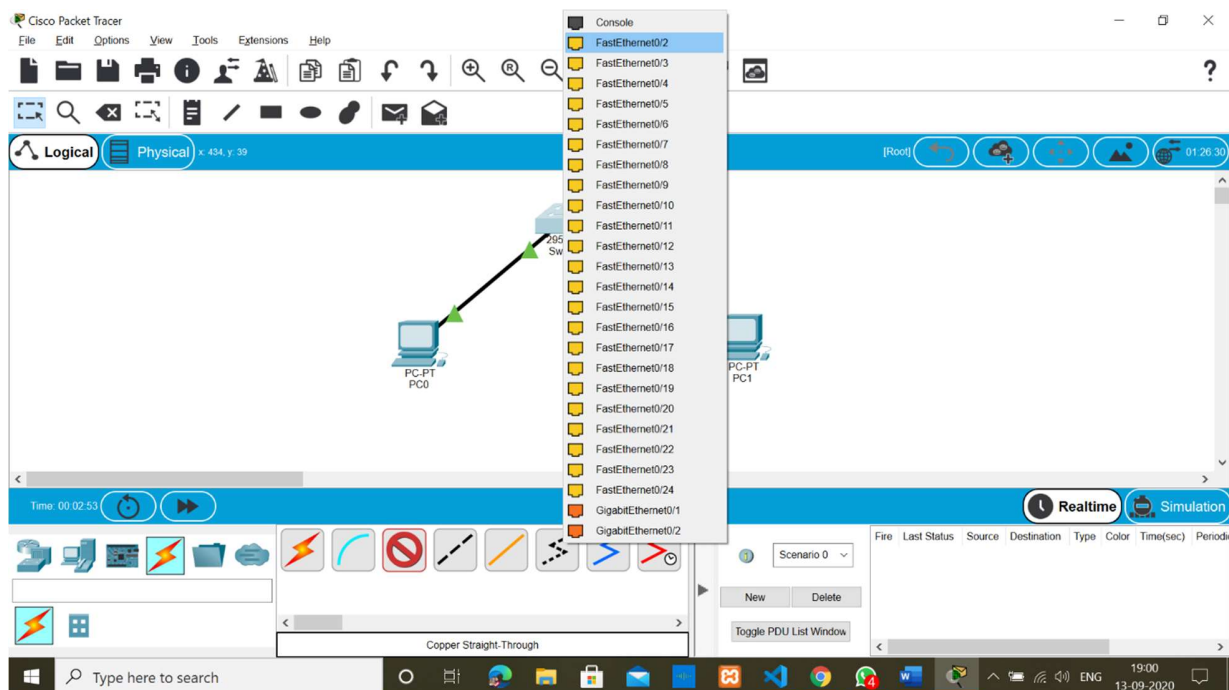

A client has requested that you set up a simple network with two PCs connected to a switch. Verify that the hardware, along with the given configurations, meet the requirements of the client.

Step 1: Set up the network topology

- a) Add two PCs and a Cisco 2950T switch
- b) Using straight-through cables, connect **PC0** to interface **Fa0/1** on **Switch0** and **PC1** to interface **Fa0/2** on **Switch0**.

c) Configure PC0 using the **Config** tab in the PC0 configuration window:

- a. IP address: 192.168.10.10
- b. Subnet Mask 255.255.255.0

The screenshot shows the PC0 configuration window with the 'Config' tab selected. The left sidebar shows the 'INTERFACE' section with 'FastEthernet0' selected. The main area displays the configuration for 'FastEthernet0'. The 'Port Status' is checked 'On'. 'Bandwidth' is set to '100 Mbps' and 'Duplex' is set to 'Full Duplex', both with 'Auto' checked. The 'MAC Address' is '0060.47D0.0E1D'. Under 'IP Configuration', 'Static' is selected, and the 'IPv4 Address' is '192.168.10.10' and 'Subnet Mask' is '255.255.255.0'. Under 'IPv6 Configuration', 'Static' is selected, and the 'IPv6 Address' is empty and 'Link Local Address' is 'FE80::260:47FF:FE00:E1D'.

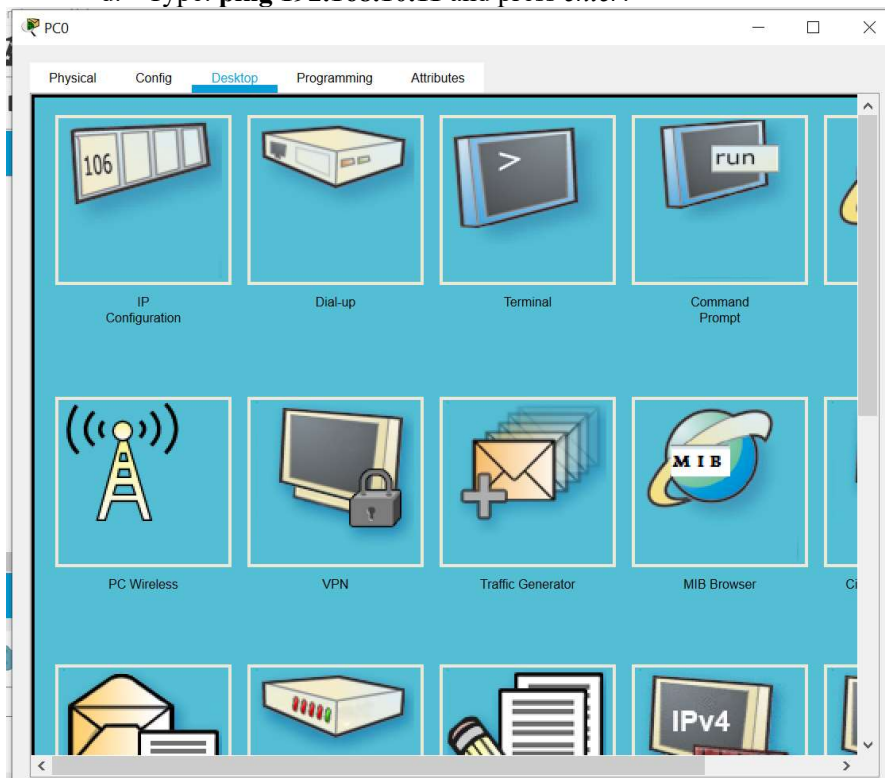

d) Configure PC1 using the **Config** tab in the PC1 configuration window

- a. IP address: 192.168.10.11
- b. Subnet Mask 255.255.255.0

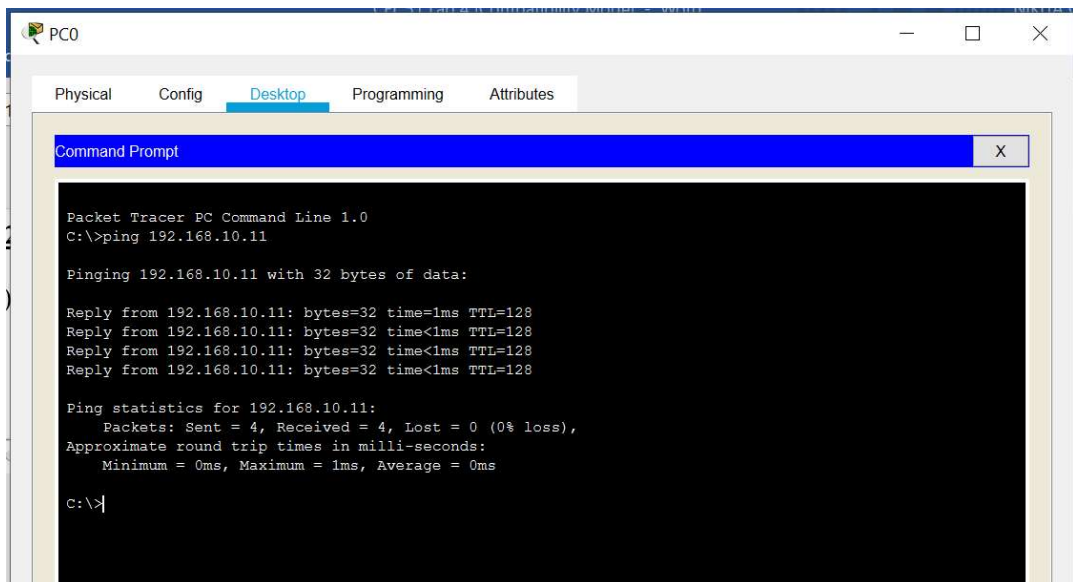

The screenshot shows the PC1 configuration window with the 'Config' tab selected. The left sidebar shows the 'INTERFACE' section with 'FastEthernet0' selected. The main area displays the configuration for 'FastEthernet0'. The 'Port Status' is checked 'On'. 'Bandwidth' is set to '100 Mbps' and 'Duplex' is set to 'Full Duplex', both with 'Auto' checked. The 'MAC Address' is '000A.F301.0AB5'. Under 'IP Configuration', 'Static' is selected, and the 'IPv4 Address' is '192.168.10.11' and 'Subnet Mask' is '255.255.255.0'. Under 'IPv6 Configuration', 'Static' is selected, and the 'IPv6 Address' is empty and 'Link Local Address' is 'FE80::20A:F3FF:FE01:AB5'.

Step 2: Test connectivity from PC0 to PC1

- a) Use the **ping** command to test connectivity.
 - a. Click PC0.
 - b. Choose the **Desktop** tab.
 - c. Choose **Command Prompt**.
 - d. Type: **ping 192.168.10.11** and press *enter*.

- b) A successful **ping** indicates the network was configured correctly and the prototype validates the hardware and software configurations. A successful ping should resemble the below output:

```
PC0
Physical Config Desktop Programming Attributes
Command Prompt
Packet Tracer PC Command Line 1.0
C:\>ping 192.168.10.11

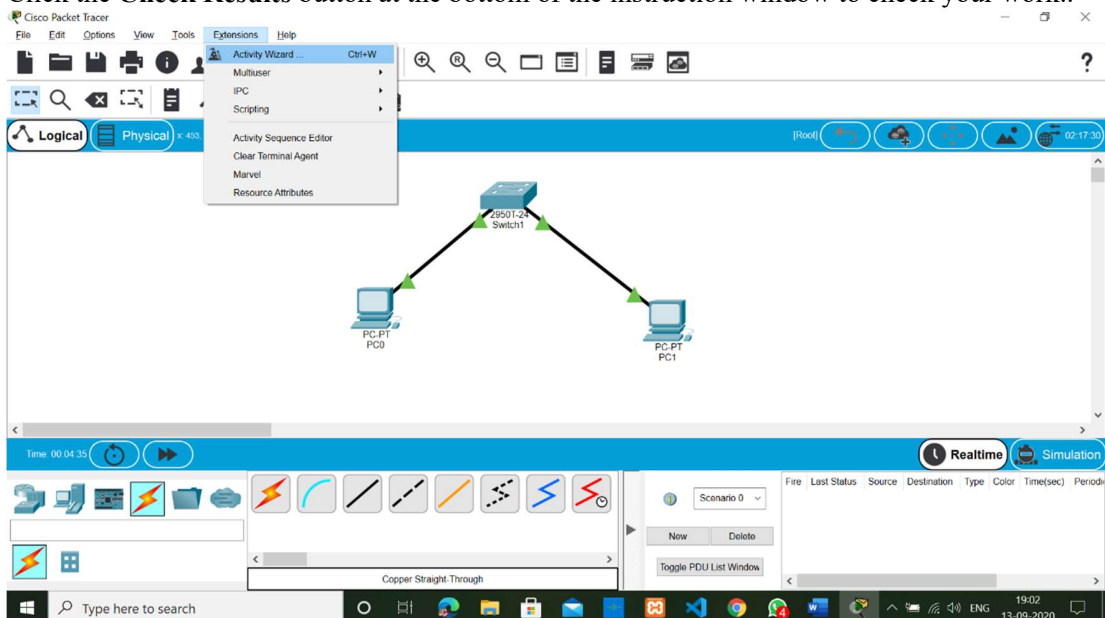

Pinging 192.168.10.11 with 32 bytes of data:

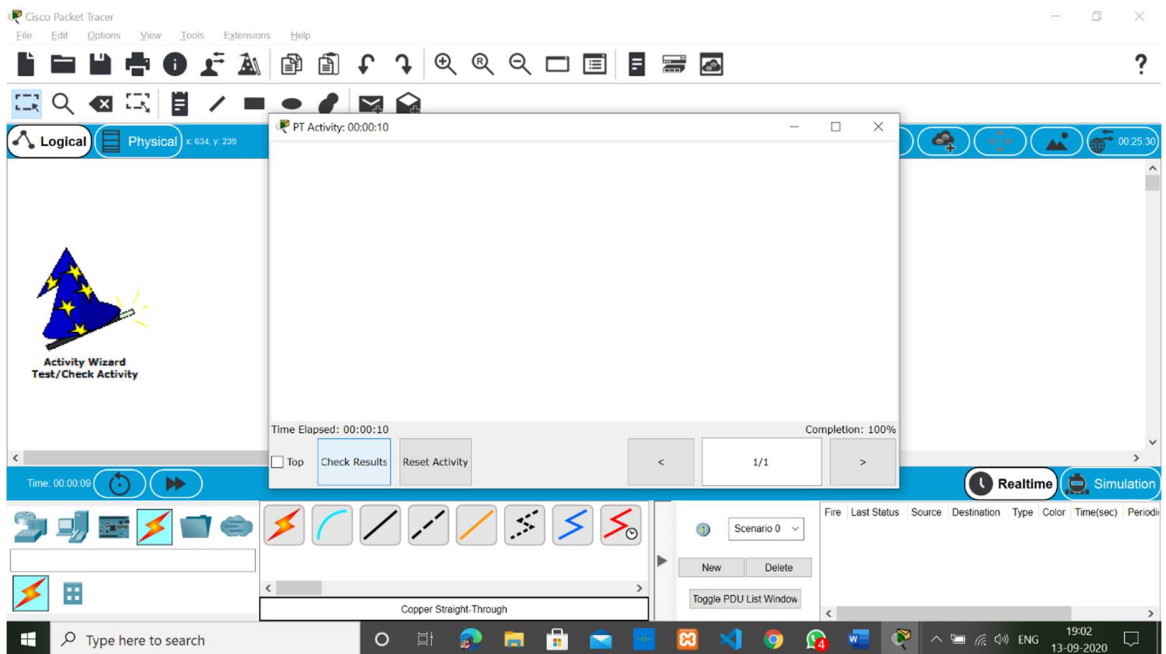

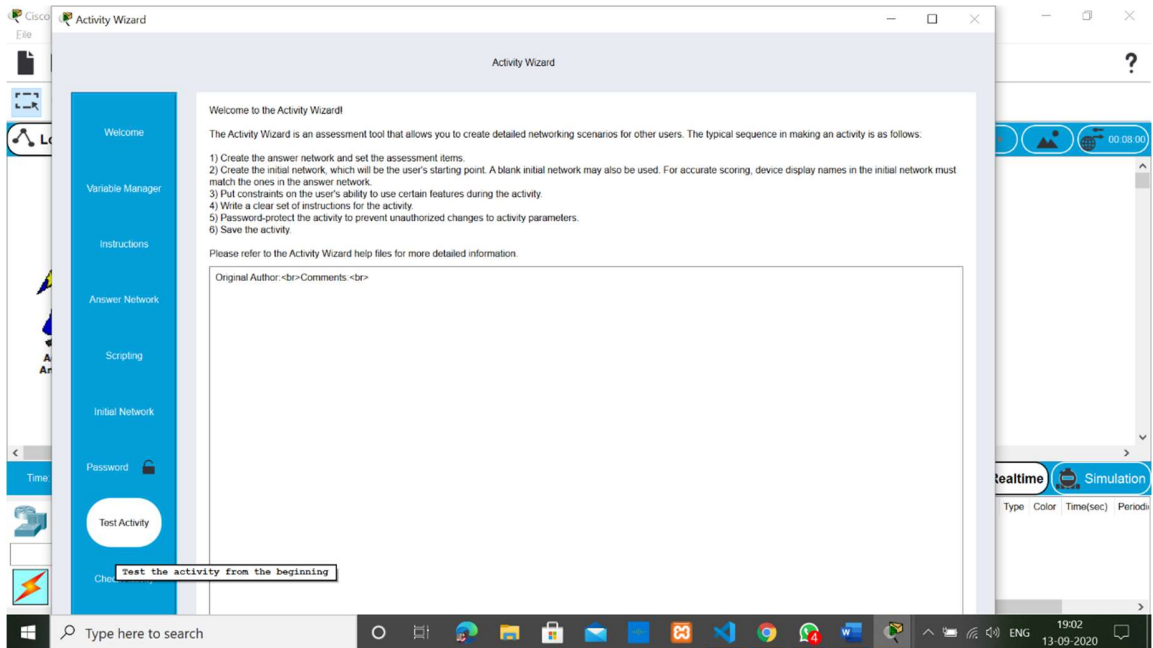

Reply from 192.168.10.11: bytes=32 time<1ms TTL=128
Reply from 192.168.10.11: bytes=32 time<1ms TTL=128
Reply from 192.168.10.11: bytes=32 time<1ms TTL=128
Reply from 192.168.10.11: bytes=32 time<1ms TTL=128

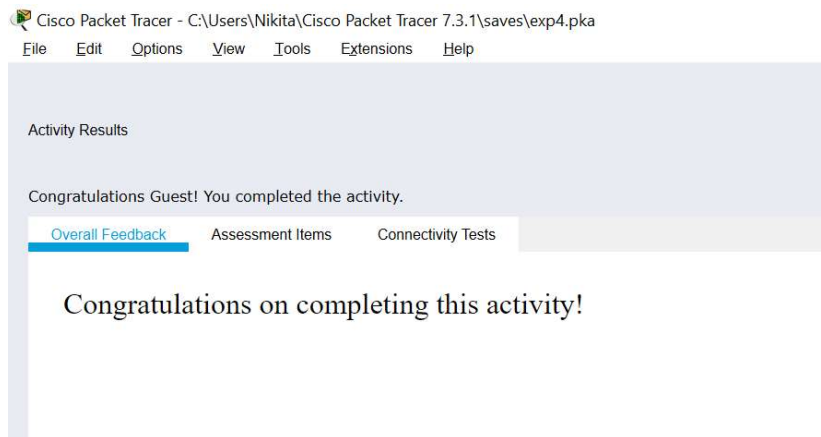

Ping statistics for 192.168.10.11:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms

C:\>
```

- c) Close the configuration window.
- d) Click the **Check Results** button at the bottom of the instruction window to check your work..

CEL51, DCCN, Monsoon 2020

Lab 4.1: Basic configuration - hostname, motd banner, passwd etc

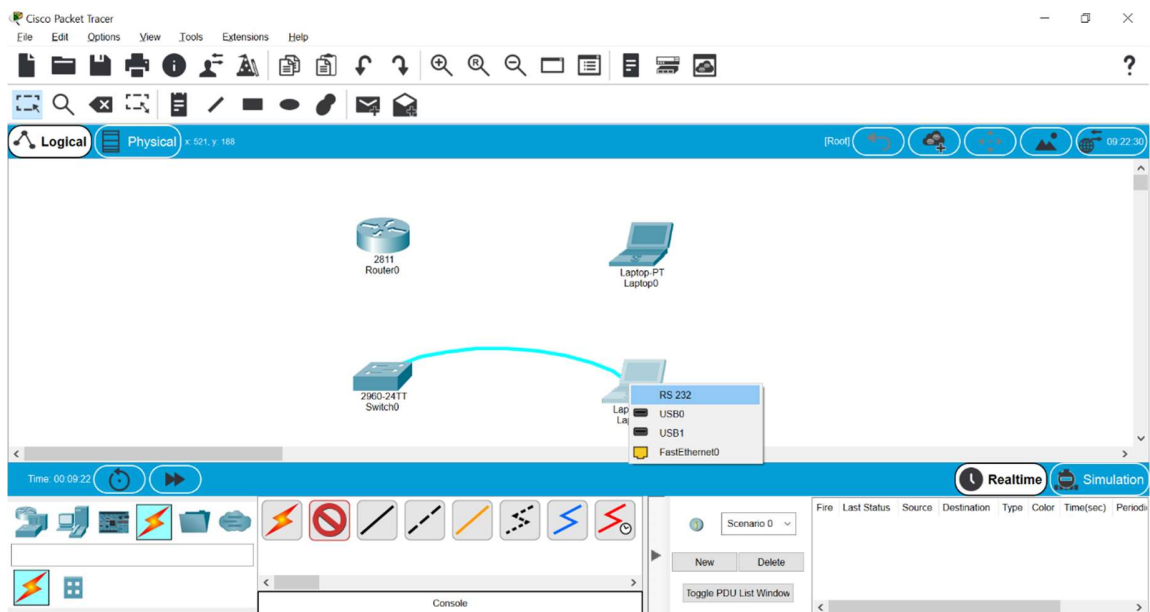

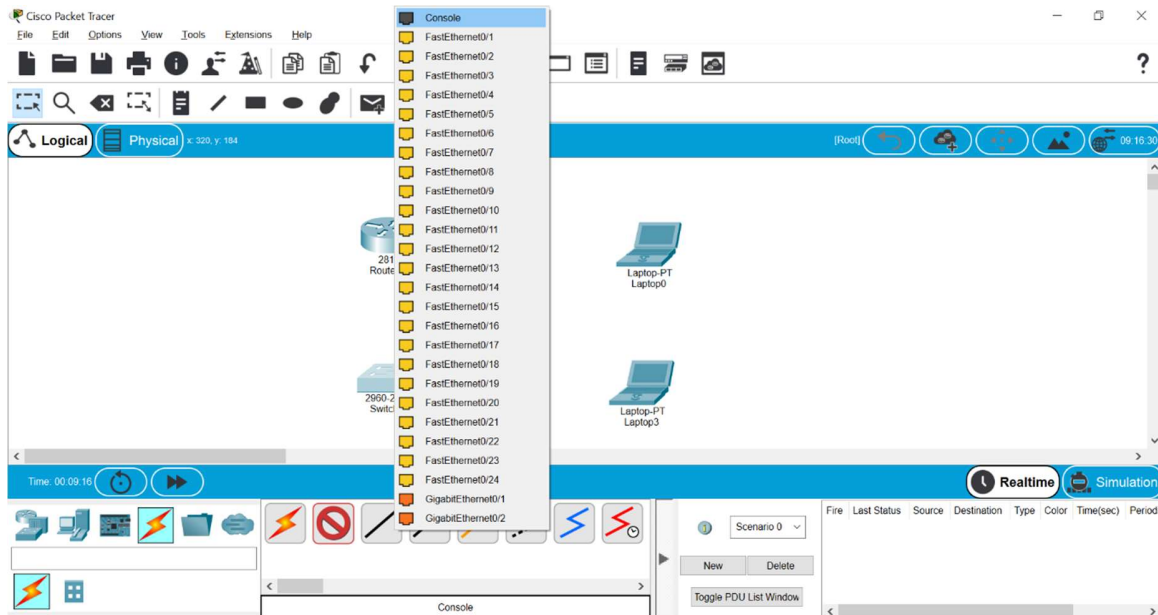

Objective:

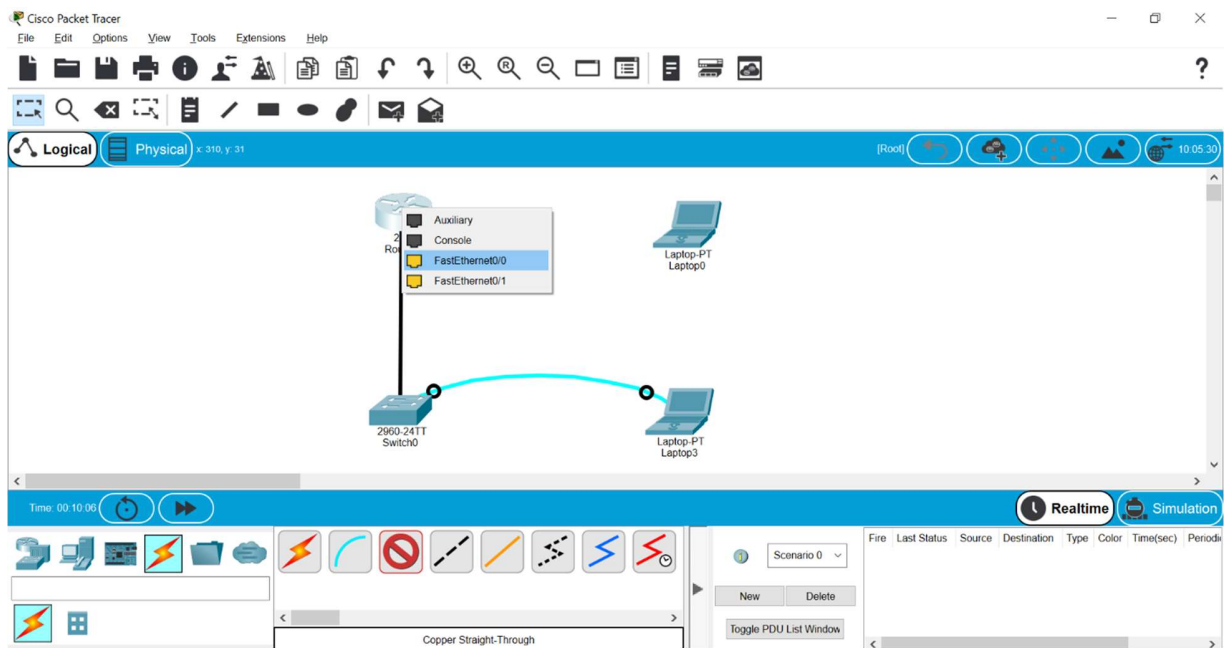

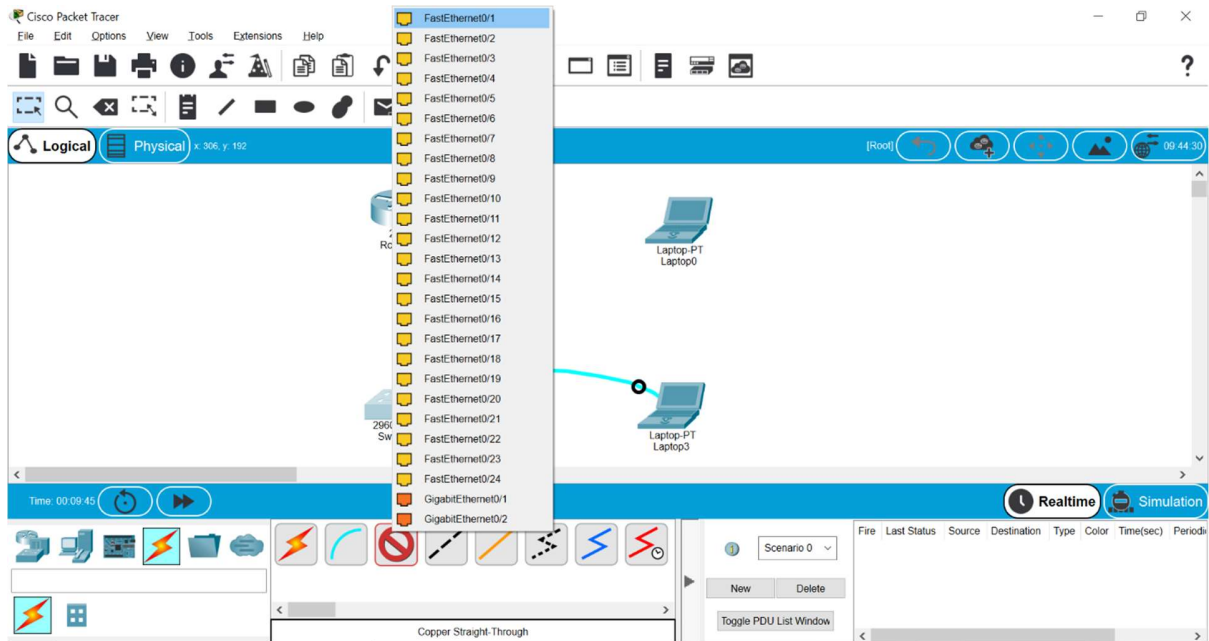

This lab will test your ability to configure basic settings such as hostname, motd banner, encrypted passwords, and terminal options on a Packet Tracer 6.2 simulated Cisco Catalyst switch.

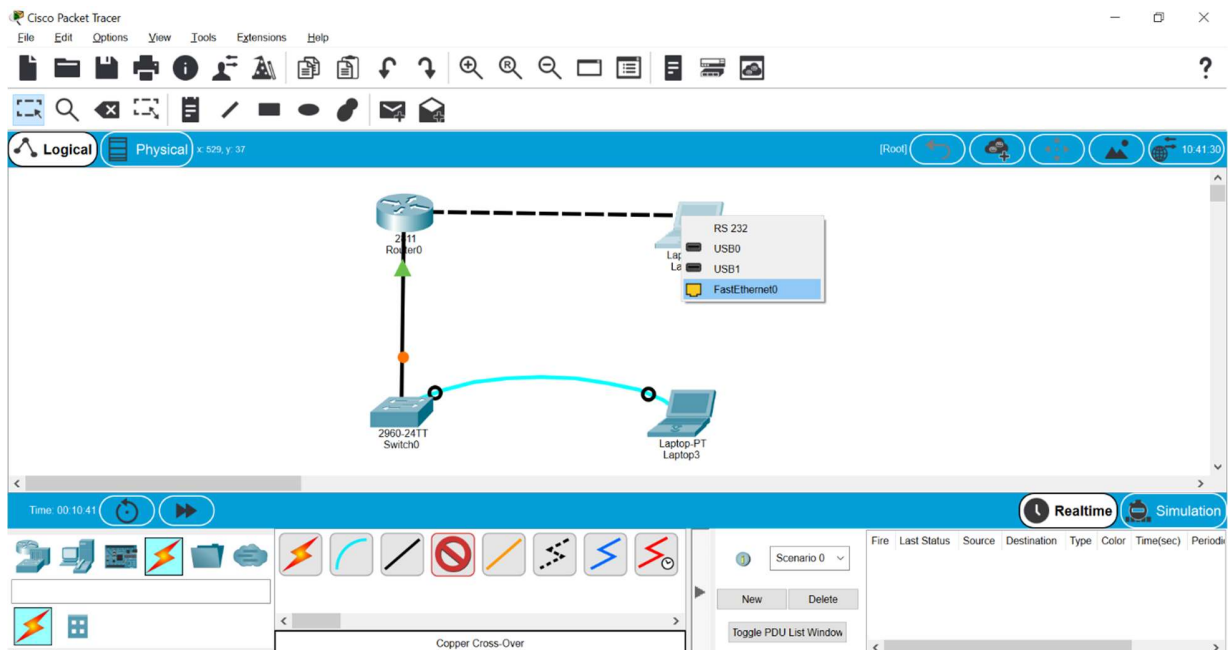

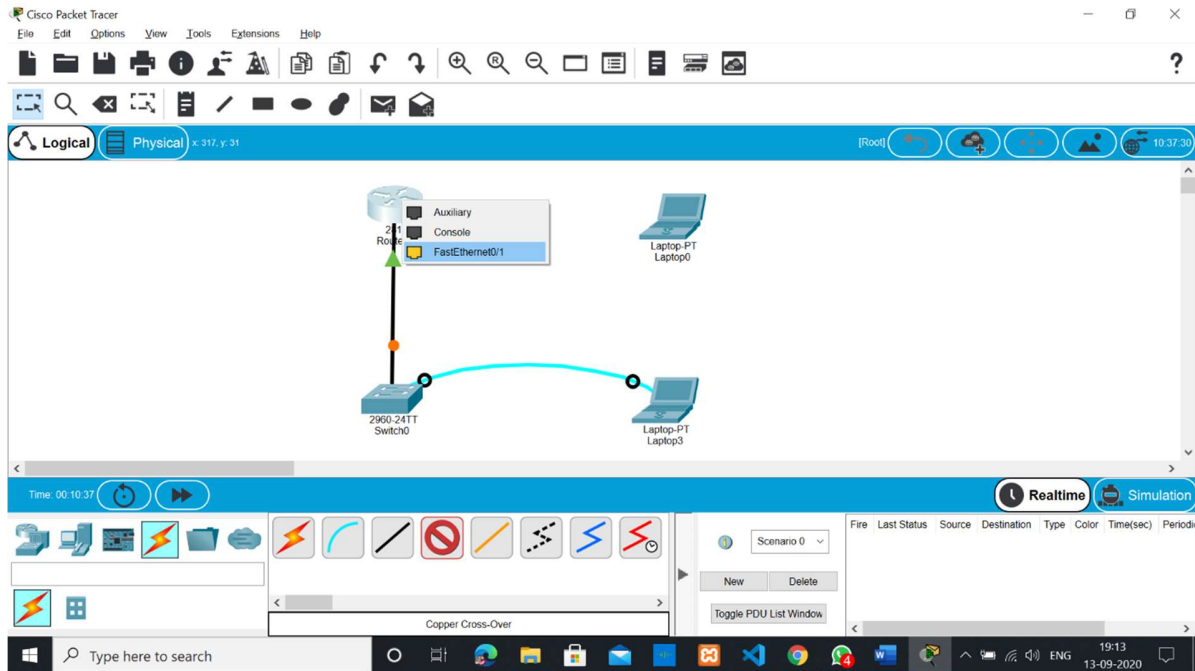

1. Use the local laptop connect to the switch console.

Router0

Physical Config CLI Attributes

GLOBAL

- Settings
- Algorithm Settings
- ROUTING**
 - Static
 - RIP
- SWITCHING**
 - VLAN Database
- INTERFACE**
 - FastEthernet0/0
 - FastEthernet0/1

FastEthernet0/0

Port Status ☒ On

Bandwidth ☒ 100 Mbps ☐ 10 Mbps ☒ Auto

Duplex ☐ Half Duplex ☒ Full Duplex ☒ Auto

MAC Address 0007.EC99.8B01

IP Configuration

IPv4 Address 192.168.1.1

Subnet Mask 255.255.255.0

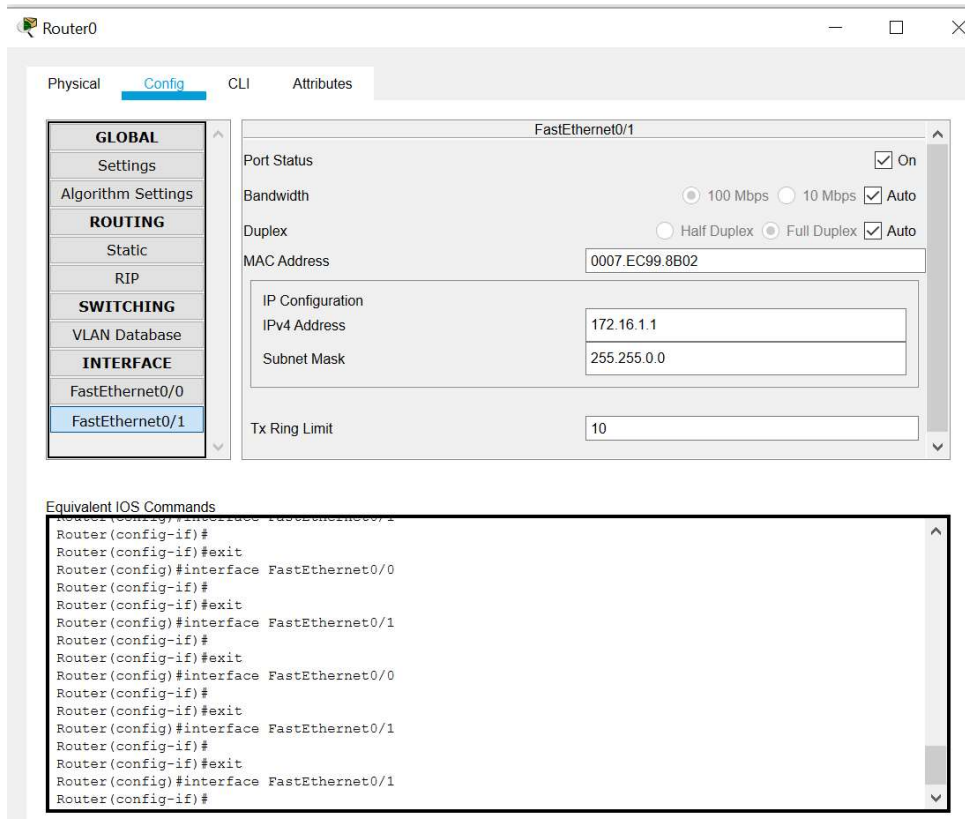

Tx Ring Limit 10

Equivalent IOS Commands

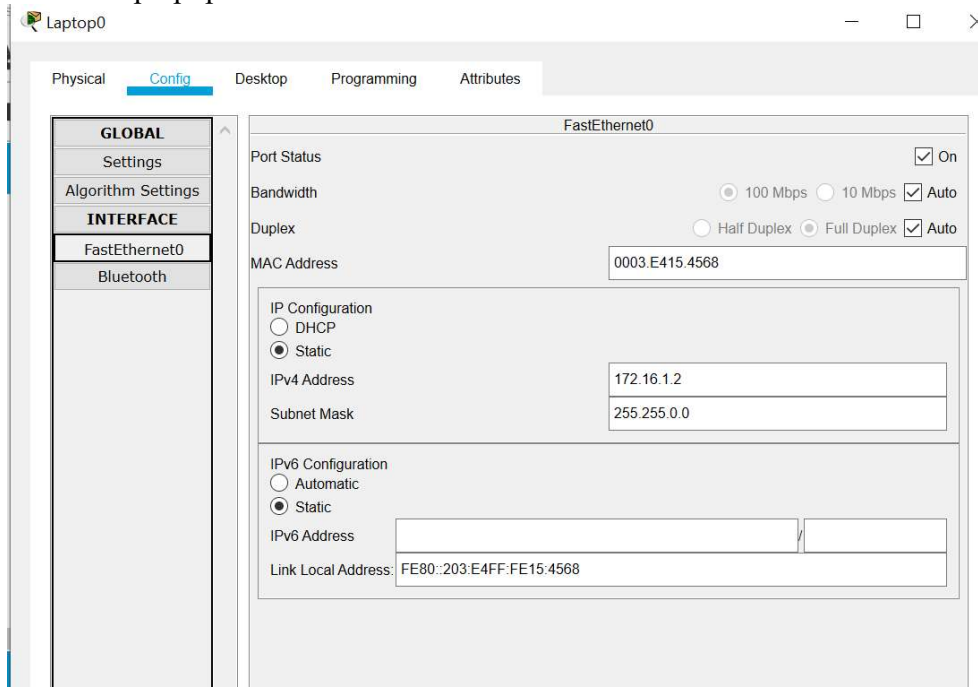

```

%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/0, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/1, changed state to up

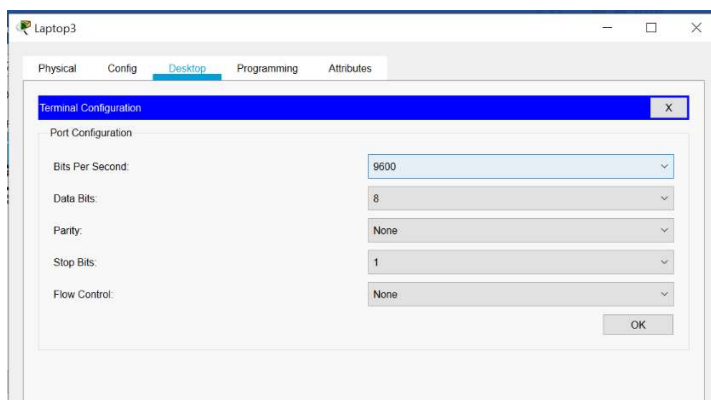

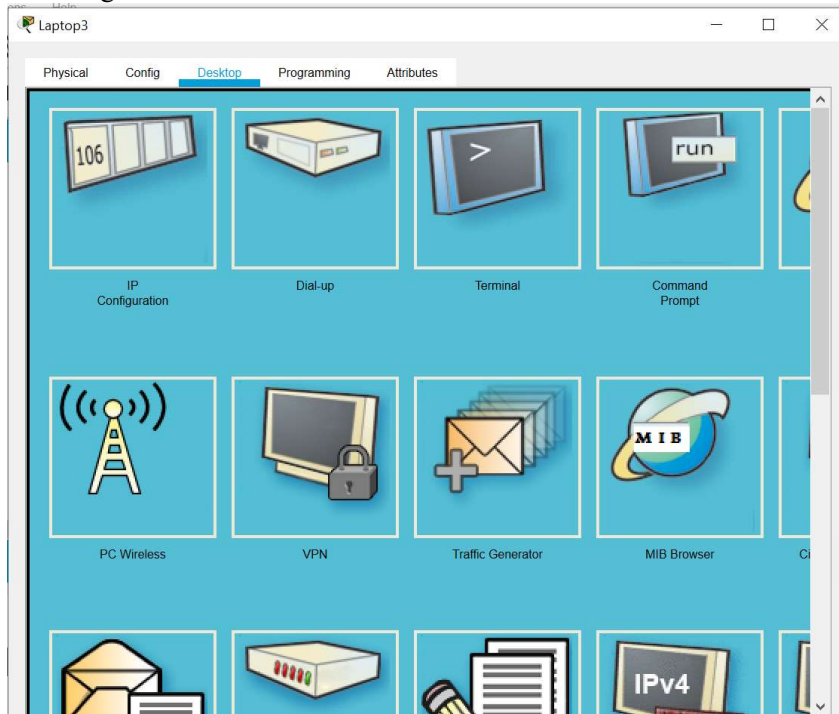

Router>enable
Router#
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#interface FastEthernet0/1
Router(config-if)#
Router(config-if)#exit
Router(config)#interface FastEthernet0/0
Router(config-if)#
  
```

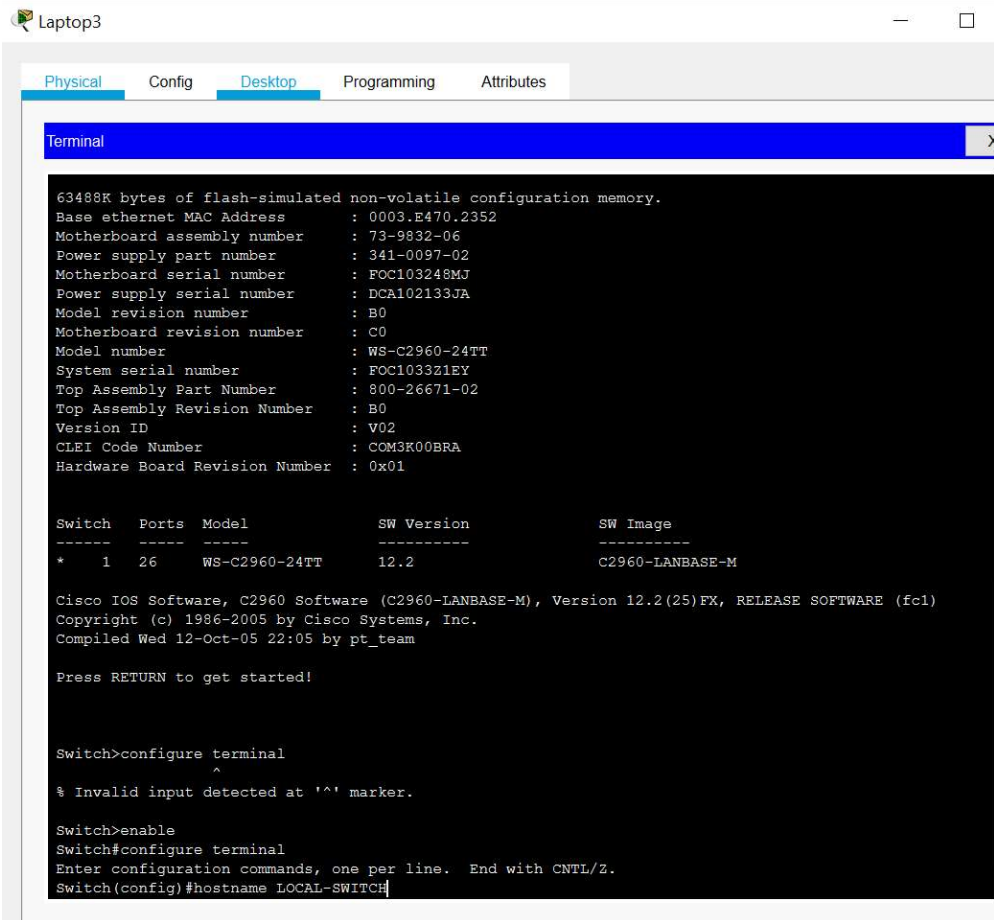

Remote laptop ip address.

2. Configure Switch hostname as LOCAL-SWITCH

```

LOCAL-SWITCH(config)#exit
LOCAL-SWITCH#
%SYS-5-CONFIG_I: Configured from console by console

LOCAL-SWITCH#show running-config
Building configuration...

Current configuration : 1086 bytes
!
version 12.2
no service timestamps log datetime msec
no service timestamps debug datetime msec
no service password-encryption
!
hostname LOCAL-SWITCH
!
!
!
!
!
spanning-tree mode pvst
spanning-tree extend system-id
!
interface FastEthernet0/1
!
interface FastEthernet0/2
--More-- |

```

3. Configure the message of the day as "Unauthorized access is forbidden"

```

LOCAL-SWITCH#enable
LOCAL-SWITCH#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
LOCAL-SWITCH(config)#banner motd #
Enter TEXT message. End with the character '#'.
Unauthorized access is forbidden#

LOCAL-SWITCH(config)#exit
LOCAL-SWITCH#
%SYS-5-CONFIG_I: Configured from console by console

LOCAL-SWITCH#
LOCAL-SWITCH#exit

```

```
LOCAL-SWITCH#  
%SYS-5-CONFIG_I: Configured from console by console
```

```
LOCAL-SWITCH#  
LOCAL-SWITCH#exit
```

```
LOCAL-SWITCH con0 is now available
```

```
Press RETURN to get started.
```

```
Unauthorized access is forbidden
```

4. Configure the password for privileged mode access as "cisco". The password must be md5 encrypted

```
LOCAL-SWITCH>enable  
LOCAL-SWITCH#configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
LOCAL-SWITCH(config)#enable secret cisco  
LOCAL-SWITCH(config)#exit  
LOCAL-SWITCH#  
%SYS-5-CONFIG_I: Configured from console by console
```

```

LOCAL-SWITCH#show running-config
Building configuration...

Current configuration : 1183 bytes
!
version 12.2
no service timestamps log datetime msec
no service timestamps debug datetime msec
no service password-encryption
!
hostname LOCAL-SWITCH
!
enable secret 5 $1$mERr$hx5rVt7rPNoS4wqbXKX7m0
!
!
!
!
!
!
spanning-tree mode pvst
spanning-tree extend system-id
!
interface FastEthernet0/1
--More-- |

```

5. Configure password encryption on the switch using the global configuration command

```

LOCAL-SWITCH#enable
LOCAL-SWITCH#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
LOCAL-SWITCH(config)#service password-encryption
LOCAL-SWITCH(config)#exit
LOCAL-SWITCH#
%SYS-5-CONFIG_I: Configured from console by console

LOCAL-SWITCH#show running-config
Building configuration...

Current configuration : 1180 bytes
!
version 12.2
no service timestamps log datetime msec
no service timestamps debug datetime msec
service password-encryption
!
hostname LOCAL-SWITCH
!
enable secret 5 $1$mERr$hx5rVt7rPNoS4wqbXKX7m0
!
!
!
!
!
!
spanning-tree mode pvst
spanning-tree extend system-id
!
interface FastEthernet0/1
--More-- |

```

6. Configure CONSOLE access with the following settings :

- Login enabled
- Password : whatever you like
- History size : 15 commands
- Timeout : 6'45"
- Synchronous logging

```
LOCAL-SWITCH#enable
LOCAL-SWITCH#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
LOCAL-SWITCH(config)#line con 0
LOCAL-SWITCH(config-line)#password ciscopackettracer
LOCAL-SWITCH(config-line)#logging synchronous
LOCAL-SWITCH(config-line)#login
LOCAL-SWITCH(config-line)#history size 15
LOCAL-SWITCH(config-line)#exec-timeout 6 45
LOCAL-SWITCH(config-line)#
```

6. Configure TELNET access with the following settings :

- Login enabled
- Password : whatever you like
- History size : 15 commands
- Timeout : 8'20"
- Synchronous logging

The term “**vtty**” stands for **Virtual teletype**. VTY is a virtual port and used to get [Telnet or SSH](#) access to the device. VTY is solely used for inbound connections to the device. These connections are all virtual with no hardware associated with them.

The abstract “**0 – 15**” means that the device can allow 16 simultaneous virtual connections which may be Telnet or SSH. In a way, we may say that 16 (0 – 15) are connection ports to the Router or Switch.

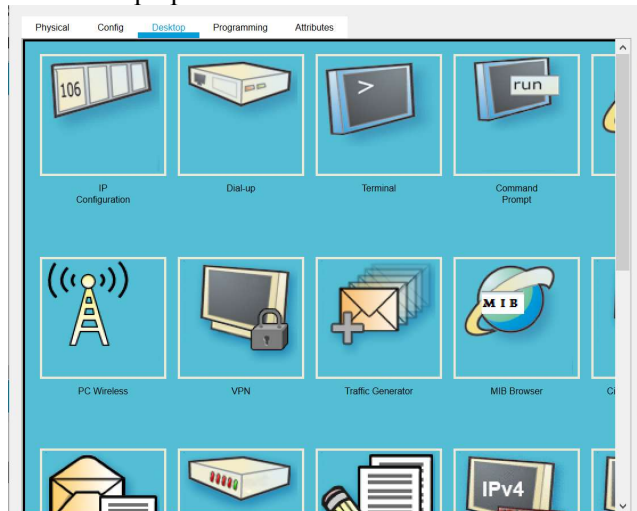

```
LOCAL-SWITCH(config-line)#line vty 0 15
LOCAL-SWITCH(config-line)#exec-timeout 8 20
LOCAL-SWITCH(config-line)#password ciscotelnet
LOCAL-SWITCH(config-line)#logging synchronous
LOCAL-SWITCH(config-line)#login
LOCAL-SWITCH(config-line)#history size 15
LOCAL-SWITCH(config-line)#
```

7. Configure the IP address of the switch as 192.168.1.2/24 and it's default gateway IP (192.168.1.1).

```
LOCAL-SWITCH(config-line)#exit
LOCAL-SWITCH(config)#interface Vlan1
LOCAL-SWITCH(config-if)#ip address 192.168.1.2 255.255.255.0
LOCAL-SWITCH(config-if)#ip default-gateway 192.168.1.1
LOCAL-SWITCH(config)#
```

8. Test telnet connectivity from the Remote Laptop using the telnet client.

Remote Laptop

```
C:\>telnet 192.168.1.2
Trying 192.168.1.2 ...Open
Unauthorized access is forbidden

User Access Verification

Password:
LOCAL-SWITCH>
```

Conclusion:-

Difference Between Router , Switch, Hub[1]:-

Hub :-

- Connects all the devices together on an internal network.
- Hub has no intelligence as to where the data has to be sent. It simply broadcasts data to all the devices connected to its ports.

Switch :-

- Connects all the devices together on an internal network.
- Switch has intelligence. It can actually learn the physical addresses of devices connected to it and stores these MAC addresses in its switch table.
- So when a data packet is sent to a switch it is only directed to the intended destination.

Hubs and Switches exchange data in a Local Area Network. It's not used to exchange data outside their own network because switches do not read IP addresses. That's where Router comes in.

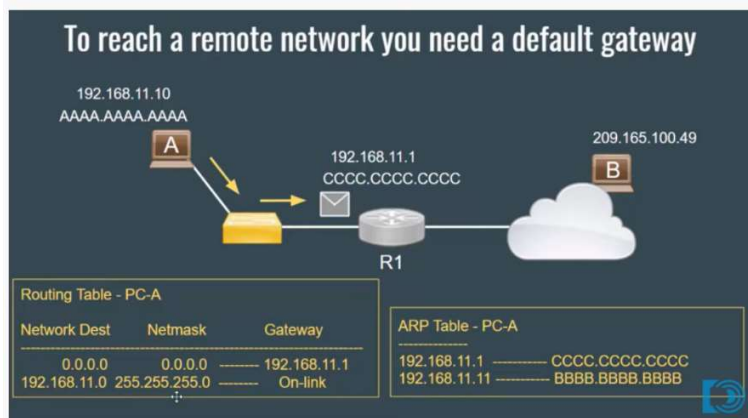

Router:-

- Routes/ forwards data from one network to another based on IP address.
- When data comes at the router, it inspects its IP address. If the data packet is meant for its own network, the router receives it. If it's meant for an outside network, it sent it off to another network.
- Router is a gateway of a network.

Hubs and Switches are used to create a network.

Router is used to connect a network.

Default Gateway [2]:-

1. Suppose PC A wants to send message to PC B.
2. So PC A looks in its routing table. There is no entry for 209.165.100.49.
3. So it has to send the msg to default gateway i.e 192.168.11.1 which is the ip address of router.
4. For that it looks in its ARP table to find MAC address of 192.168.11.1.
5. Once it gets the mac address, switch sends the msg to the router.
6. Router then finds the best path and sends the msg to 209.165.100.49.

VLAN:-

- VLAN or Virtual LAN is a subnet.
- In above figure, each color represents a different subnet.
- If the first PC from left wants to send msg to second PC from left, the msg will go to the switch and then to second pc
- If the first PC from left wants to send msg to third PC from left, the msg will go to switch, since both the PCs are not on the same subnet, the msg will go to the router and from there it will go the switch and then to third PC.

Virtual Network of same Physical LAN:
